

Features of new version

1. A check of the order price for getting into the price range was added if the **Highest tolerable price** and **Lowest tolerable price** parameters for the closing instrument are available:
 - For buy orders, the minimum between the calculated price and the maximum possible price is taken. In the absence of the **Highest tolerable price** parameter, the calculated price is taken.
 - For sell orders, the maximum between the calculated price and the minimum possible price is taken. In the absence of the parameter **Lowest tolerable price**, the calculated price is taken.
2. The ability to limit the list of instruments for closing positions on the derivatives market to a list explicitly specified in the template was added. For the description of the new **Only fixed list** setting, see the User's manual, sub-section 6.4.1.
3. Ability to close options positions at the theoretical price in the absence of counter-bid/offer was added. For the description of the new **Use theoretical price if no counter orders** setting, see the User's manual, sub-sections 5.3.3 and 6.4.
4. Implemented the possibility of predominantly using the small lot mode for closing currency positions. This functionality depends on the order of the indicated instruments in the **Instruments for closing positions on FX market** list. For the description see the User's manual, sub-section 6.4.3.
5. The **Consider active orders on derivatives market** setting was renamed to **Consider active orders**. This setting now allows you to disable the considering of active orders in all markets for all schemes. For the description of the **Consider active orders** setting, see the User's manual, sub-section 6.4.
6. The ability to automatically cancel all active orders that prevent closing positions to the required state was added. For the description of the new **Cancel active orders** setting, see section 5.3.3 of the User's Guide.
