

Features of new version

Due to the upcoming update of the Moscow Exchange trading system on September 16, 2024 (<https://www.moex.com/n71866>), the **Open position type** parameter becomes a key parameter, this change affects the following QUIK Workstation tables:

- Asset liabilities and claims [CCP];
- Cash liabilities and claims [CCP];
- Cash liabilities and claims [Currency].

Issues resolved

1. Incorrect volume calculation on the order entry form in the REPO with CCP modes.
2. Underestimated calculation of the maximum for buying and selling on the order entry form.
3. Emergency shutdown when setting the **Create window** menu items.
4. In some cases, after reconnecting the terminal to the QUIK server, the statuses of orders that were active at the moment of disconnection from the server were not updated.
